Pounds of Paper

You've probably use paper in some way every day of you're life.

Cellulose Fibers which is found in all plant cell walls are a key ingredient in paper. When a mixture of these fibers and water are filtered thru a screen the fibers tangle together, forming a sheet of pulpy substance. On top of the screen. When the fiber dries it is peeled from the screen, and packaged as paper. Papermaking is a continual process, this shouldn't come as no surprise when you considered the fact that the Average American uses about 660 lbs. (330 kgs.) of paper products each year.

Anyone for Cricket?

Cricket is one of the most popular games in England. And many other countrys that was once british colonys. The game involves 2 teams of 11 players, and they take turns batting and fielding. The striker, the person which is batting tries to hit the ball into the field, the striker uses a long, flat-sided bat to hit the ball, which is bounced once by the bowler (the player delivering the ball) before it is hit. Than the striker ran back and forth among 2 groups of sticks called wickets, trying to score as many runs as possible. Although the game has a few similarities to baseball the 2 are actualy quiet different.
